

Monthly Precipitation Graph

Precipitation (rain, snow, sleet or hail) is very important to gardeners. Without adequate water, plants are not able to survive. Vegetable plants rely on water not only for their own survival, but also for the production of the fruit. Water makes up to 80 to 90% of their weight when picked off the vine.

To determine the amount of rainfall for your area for a given month, watch your local weather station or do a search on the internet.
